Resource Analysis

- Resource Analysis is a fundamental problem
- it is used to understand the efficiency of algorithms
- it is used to identify bugs

Resource Analysis

- Resource Analysis is a fundamental, **undecidable** problem
- it is used to understand the efficiency of algorithms
- it is used to identify bugs
- (Fully automated) Static analysis is in general not complete:

What To Do When Automation Fails?

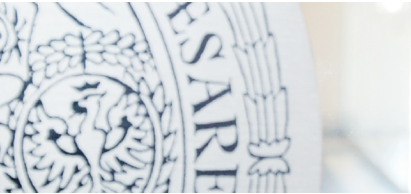

Statistical Approach

run program on various inputs, measure the cost, infer complexity empirically

Our Work¹

We have implemented this idea for term rewrite systems and compared our approach against known results.

¹Samuel Frontull, Manuel Meitinger, and Georg Moser. “Data-Driven Runtime Complexity Analysis”. In: *15th International Symposium on Frontiers of Combining Systems (FroCoS 2025)*. Springer Nature Switzerland, 2025, pp. 228–246.

Runtime Complexity of a Term Rewrite System (TRS)

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$t = s(s(0)) \cdot s(s(s(0)))$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$t = s^2(0) \cdot s^3(0)$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$t = s^2(0) \cdot s^3(0) \rightarrow (s^2(0) \cdot s^2(0)) + s^2(0)$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$t = s^2(0) \cdot s^3(0) \rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0)$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \end{aligned}$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \rightarrow ((0 + s^2(0)) + s^2(0)) + s^2(0) \end{aligned}$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \rightarrow ((0 + s^2(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (s^2(0) + s^2(0)) + s^2(0) \end{aligned}$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \rightarrow ((0 + s^2(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (s^2(0) + s^2(0)) + s^2(0) \rightarrow^* s^6(0) \end{aligned}$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \rightarrow ((0 + s^2(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (s^2(0) + s^2(0)) + s^2(0) \rightarrow^* s^6(0) \end{aligned}$$

Multiplication and Addition as TRS

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Example

basic term

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \rightarrow ((0 + s^2(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (s^2(0) + s^2(0)) + s^2(0) \rightarrow^* s^6(0) \end{aligned}$$

normal form

Multiplication and Addition in TDC

defined symbols

constructors

$$\mathcal{F} := \{0/0, s/1, +/2, \cdot/2\}$$

$$\mathcal{F}_D := \{\cdot, +\}$$

$$\mathcal{F}_C := \{0, s\}$$

$$\mathcal{R} :=$$

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

basic term

Example

$$\begin{aligned} t = s^2(0) \cdot s^3(0) &\rightarrow (s^2(0) \cdot s^2(0)) + s^2(0) \rightarrow ((s^2(0) \cdot s(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (((s^2(0) \cdot 0) + s^2(0)) + s^2(0)) + s^2(0) \rightarrow ((0 + s^2(0)) + s^2(0)) + s^2(0) \\ &\rightarrow (s^2(0) + s^2(0)) + s^2(0) \rightarrow^* s^6(0) \end{aligned}$$

normal form

Runtime Complexity of a TRS

$s^2(0) \cdot s^3(0) \rightarrow \dots \rightarrow s^6(0)$ in 10 steps

Runtime Complexity of a TRS

$s^2(0).s^3(0) \rightarrow \dots \rightarrow s^6(0)$ in **10** steps

Derivation Height

Let $s, t \in \mathcal{T}(\mathcal{F}, \mathcal{V})$ such that t is in normal form. The *derivation height* of a term s wrt. a well-founded, finitely-branching relation \rightarrow is defined as $\text{dh}(s, \rightarrow) := \max\{n \mid \exists t. s \rightarrow^n t\}$

$$\text{dh}(s^2(0).s^3(0), \rightarrow) = \max\{\mathbf{10}, \dots\}$$

Runtime Complexity of a TRS

$s^2(0).s^3(0) \rightarrow \dots \rightarrow s^6(0)$ in **10** steps

Derivation Height

Let $s, t \in \mathcal{T}(\mathcal{F}, \mathcal{V})$ such that t is in normal form. The *derivation height* of a term s wrt. a well-founded, finitely-branching relation \rightarrow is defined as $\text{dh}(s, \rightarrow) := \max\{n \mid \exists t. s \rightarrow^n t\}$

$$\text{dh}(s^2(0).s^3(0), \rightarrow) = \max\{\mathbf{10}, \dots\}$$

Runtime Complexity

$$\text{rc}_{\mathcal{R}}(n) := \max\{\text{dh}(s, \rightarrow_{\mathcal{R}}) \mid s \text{ is basic and } |s| \leq n\}$$

Runtime Complexity of a TRS

$s^2(0).s^3(0) \rightarrow \dots \rightarrow s^6(0)$ in **10** steps

Derivation Height

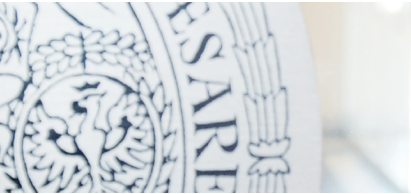

Let $s, t \in \mathcal{T}(\mathcal{F}, \mathcal{V})$ such that t is in normal form. The *derivation height* of a term s wrt. a well-founded, finitely-branching relation \rightarrow is defined as $\text{dh}(s, \rightarrow) := \max\{n \mid \exists t. s \rightarrow^n t\}$

$$\text{dh}(s^2(0).s^3(0), \rightarrow) = \max\{\mathbf{10}, \dots\}$$

Runtime Complexity

$$\text{rc}_{\mathcal{R}}(n) := \max\{\text{dh}(s, \rightarrow_{\mathcal{R}}) \mid s \text{ is basic and } |s| \leq n\}$$

$$|s^2(0).s^3(0)| = 8, \text{rc}_{\mathcal{R}}(8) = ?$$

Worst-Case Input Computation

Simple and Complex Rules

Definition

A rewrite rule $\ell \rightarrow r$ is *simple* if r does not contain any defined symbol or $\text{arity}(\ell) = 0$. Otherwise, it is *complex*.

$$1: \quad x \cdot s(y) \rightarrow (x \cdot y) + x$$

$$2: \quad x \cdot 0 \rightarrow 0$$

$$3: \quad s(x) + y \rightarrow s(x + y)$$

$$4: \quad 0 + x \rightarrow x$$

$$5: \quad x + s(y) \rightarrow s(x + y)$$

$$6: \quad x + 0 \rightarrow x$$

Simple and Complex Rules

Definition

A rewrite rule $\ell \rightarrow r$ is *simple* if r does not contain any defined symbol or $\text{arity}(\ell) = 0$. Otherwise, it is *complex*.

Complex Rules:

$$1: \quad x \cdot s(y) \rightarrow^1 (x \cdot y) + x$$

$$3: \quad s(x) + y \rightarrow^1 s(x + y)$$

$$5: \quad x + s(y) \rightarrow^1 s(x + y)$$

Simple Rules:

$$2: \quad x \cdot 0 \rightarrow^1 0$$

$$4: \quad 0 + x \rightarrow^1 x$$

$$6: \quad x + 0 \rightarrow^1 x$$

We write $s \rightarrow^n t$ if exactly n steps are performed to rewrite s to t .

Narrowing

Narrowing

Let $s, t \in \mathcal{T}(\mathcal{F}, \mathcal{V})$. $s \rightsquigarrow_{\mathcal{R}, \mu|V(s)} t$ if $\text{mgu}(s|_p, \ell) = \mu$ and $\ell \rightarrow r \in \mathcal{R}$ and $p \in \text{FPos}(s)$.

Combination of Simple and Complex Rules

Let $s : \ell_s \rightarrow^a r_s$ be a simple rule and $c : \ell_c \rightarrow^b r_c$ a complex rule². If $r_c \rightsquigarrow_{\mathcal{R}, \mu|V(s)} \ell_s$, then $\ell_c \mu \rightarrow^{a+b} r_s \mu$. We denote this combination by $c \circ s$.

$$c_1: \quad x \cdot s(y) \rightarrow^1 (x \cdot y) + x$$

$$s_6: \quad x + 0 \rightarrow^1 x$$

²we rename variables such that $\text{Var}(s) \cap \text{Var}(c) = \emptyset$

Narrowing

Ed. by David Madigan and Padhraic Smyth. Vol. R1. Proceedings of Machine Learning Research. PMLR, 1997, pp. 347–354. URL: <https://proceedings.mlr.press/r1/mcgeoch97a.html>.

From Measurements to Complexity

Lagrange Interpolation Theorem⁴

Given $n + 1$ points $(x_0, y_0), \dots, (x_n, y_n)$ with pairwise distinct x_i , there exists a *unique* polynomial P_n of degree at most n such that $P_n(x_i) = y_i$ for all $i \in \{0, 1, \dots, n\}$.

The Newton form of a polynomial of degree n is expressed as:

$$P_n(x) = \sum_{k=0}^n a_k \cdot \prod_{j=0}^{k-1} (x - x_j)$$

where $\prod_{j=0}^{-1} (x - x_j) = 1$.

The (unique) coefficients a_k can be computed using the divided-difference scheme.

⁴Josef Stoer et al. *Introduction to numerical analysis*. Vol. 1993. Springer, 1980.

Divided-Differences

	$k = 0$	$k = 1$	$k = 2$	\dots	$k = n$
x_0	y_0	y_0^1	y_0^2	\dots	y_0^n
x_1	y_1	y_1^1	y_1^2		
x_2	y_2	y_2^1			
\vdots	\vdots				
x_n	y_n				

where $y_j^{k+1} = \frac{y_{j+1}^k - y_j^k}{x_{j+1} - x_j}$ ($y_i^0 = y_i$) with $k > 0$ and $j \leq n - k$.

Interpolating Polynomial

$$P_n(x) = y_0 + y_0^1(x - x_0) + \dots + y_0^n(x - x_0)(x - x_1) \dots (x - x_{n-1})$$

Divided-Differences

Theorem

If $P(x)$ is a polynomial of degree n with $P(x_i) = y_i$, then $y_0^k = 0$ for $k > n$.

Proof.

Because of the unique solvability $P_k(x) = P(x)$ for $k \geq n$. The coefficients y_0^k in P_n must therefore vanish for $k > n$. 

Divided-Differences

Theorem

If $P(x)$ is a polynomial of degree n with $P(x_i) = y_i$, then $y_0^k = 0$ for $k > n$.

Proof.

- Accuracy is defined wrt. to known results on the (innermost) runtime complexity of TRSs.
- *fp + term.* are TRSs that encode (uniformly) terminating functional programs (left-linear, strongly non-overlapping constructor TRSs).

Limitation

We may not be able to find (enough) worst-case inputs

timeout or memory constraints

Summary

Conclusion and Next Steps

Contributions

- we have developed a (fast) method to synthesise worst-case inputs for term rewrite systems that model functional programs
- we have shown how to estimate the asymptotic complexity on the inferred measurements
- we have validated our approach on the TPDB

Future Work

- integration of machine learning techniques for rule selection
- infer polynomial bounds
- guarantees on the input size

Divided-Differences – Example

	$k = 0$	$k = 1$	$k = 2$
0	1	2	$-5/6$
1	3	$-1/2$	
3	2		

Interpolating Polynomial

$$P_n(x) = y_0 + y_0^1(x - x_0) + \cdots + y_0^n(x - x_0)(x - x_1) \cdots (x - x_{n-1})$$

$$P_2(x) = 1 + 2(x - 0) - 5/6(x - 0)(x - 1)$$

$$P_2(x) = 1 + \frac{17}{6}x - \frac{5}{6}x^2$$

Divided-Differences – Example

	$k = 0$	$k = 1$	$k = 2$
0	1	2	$-5/6$
1	3	$-1/2$	
3	2		

Interpolating Polynomial

$$P_n(x) = y_0 + y_0^1(x - x_0) + \cdots + y_0^n(x - x_0)(x - x_1) \cdots (x - x_{n-1})$$

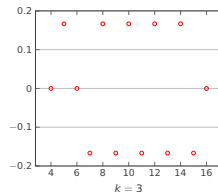

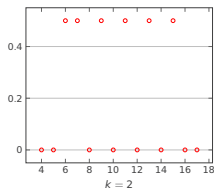

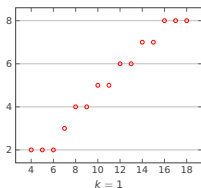

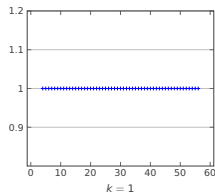

$$P_2(x) = 1 + 2(x - 0) - 5/6(x - 0)(x - 1)$$

$$P_2(x) = 1 + \frac{17}{6}x - \frac{5}{6}x^2$$

The Difference Rule⁶

The Difference Rule

extends Newton's divided difference method for polynomial interpolation to be defined when Y contains random noise. The method iterates numerical differentiation until the data **appears non-increasing**.
